Agriculture and Food Crisis

Farmer Distress

High Costs of Cultivation
(Seeds, Fertilizers, Pesticides)

Prolonged Dry Spells,
Droughts, Crop Failures

Acute water shortages, Drying of Borewells

Problems faced by Tenants,
Rural-Urban Distress Migration

Unseasonal Rain,
More Frequent Cyclones

Market Uncertainty

Consumer Food Plate

Food Scarcity

Chemical Residues

Lack of Nutrients

Health Hazards

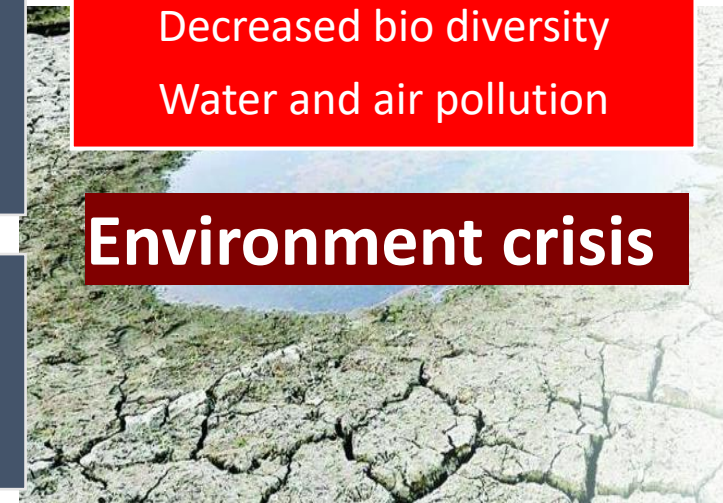

Soil degradation,
Continuous loss of soil organic matter

Water stress

Heatwaves – global warming

Decreased bio diversity
Water and air pollution

Environment crisis

Climate injustice - disproportionate burdens

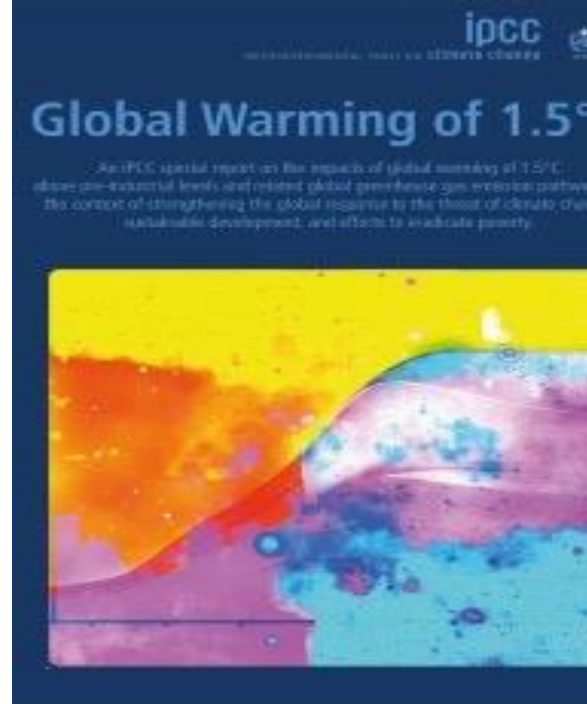

IPCC 1.5 SR: Warning

Intergovernmental Panel on Climate Change, Oct 2018

To limit warming at 1.5°C, governments and private businesses **must make unprecedented changes**, on a sweeping **global scale**, in:

- *energy systems*
- ***land management***
- *building efficiency*
- *industrial operations*
- *shipping and aviation*
- *city-wide design*

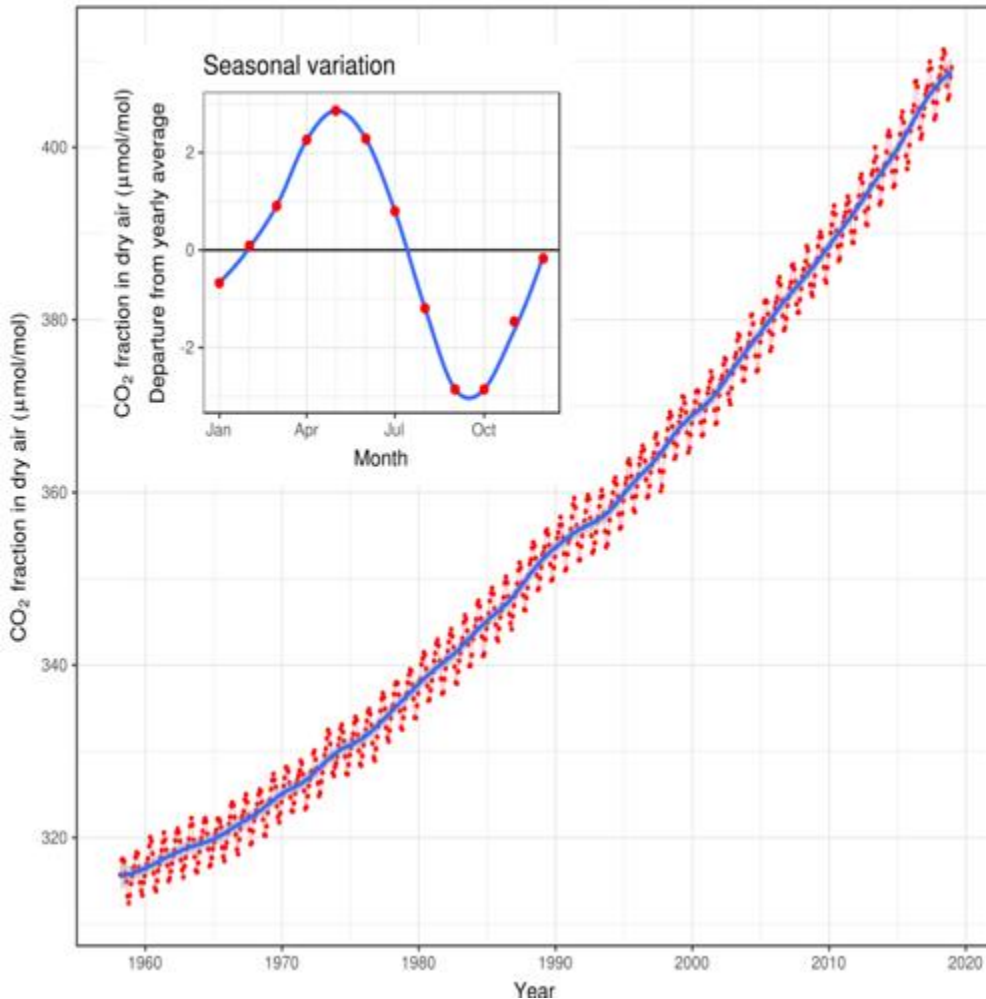

UN Chief Executives Board Meeting, 09 May 2019

Joint Appeal: UN Calls Upon Member States to Pursue Ambitious Climate Action

We have **12 years** to limit climate change catastrophe, warns UN

Climate solution - drawdown

Monthly mean CO₂ concentration

Carbon: emissions and drawdown

CO₂
Half Life
100 years

Humus
Stable Carbon
500 to 2000 years

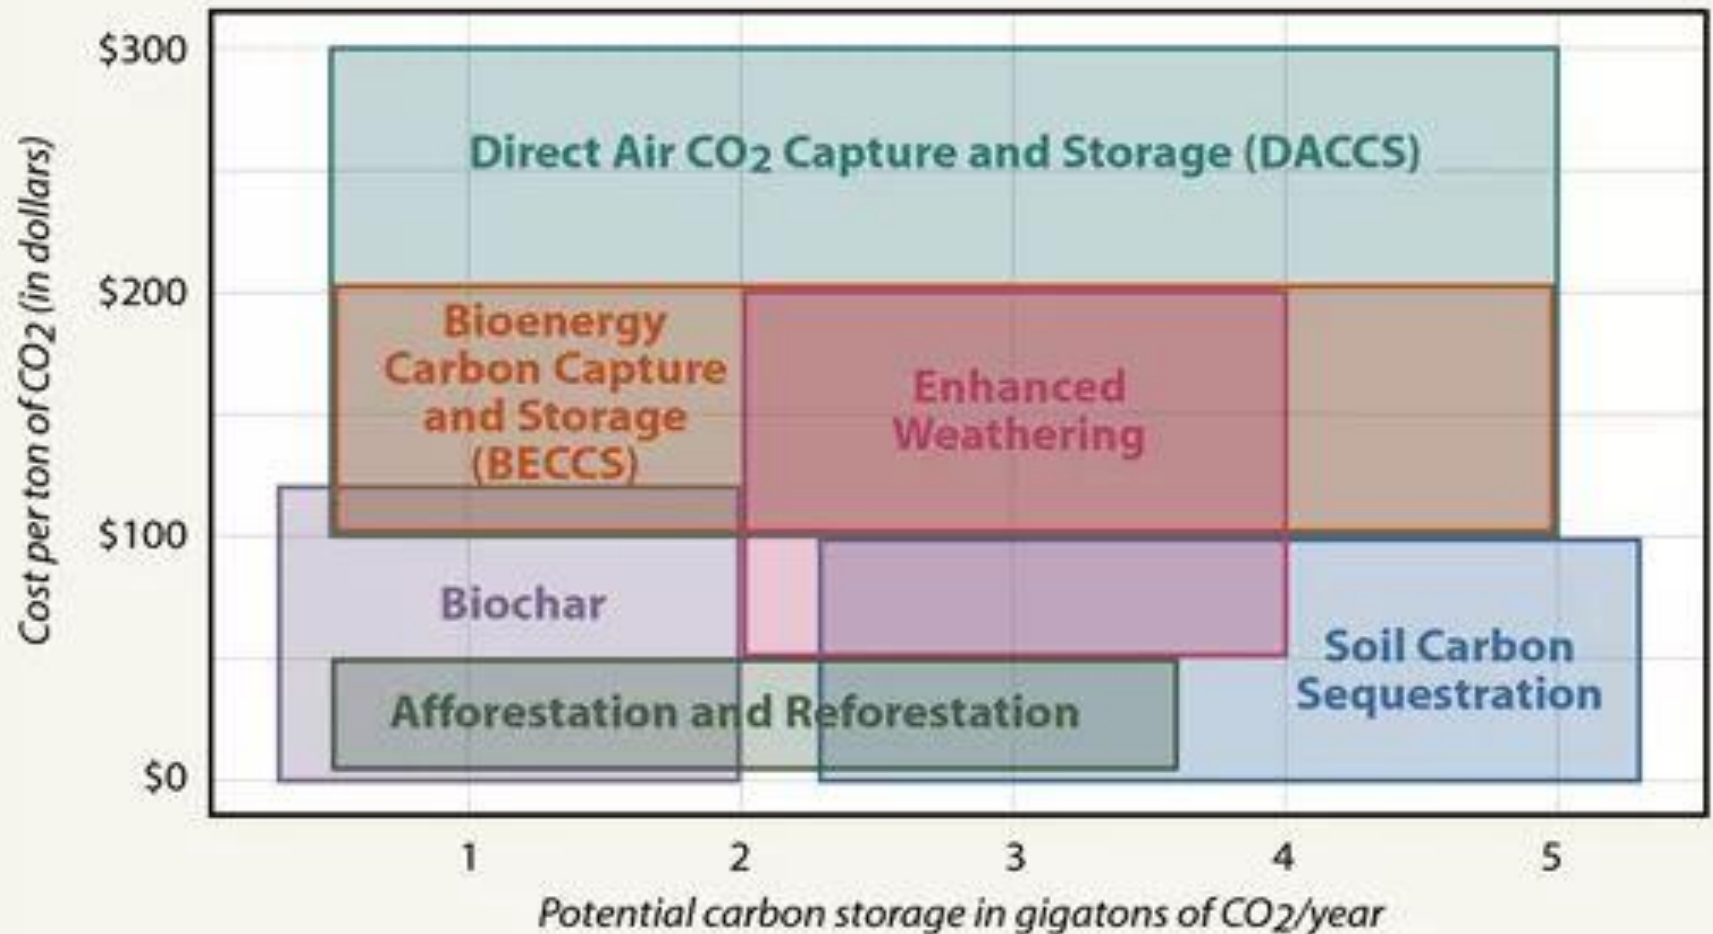

Intergovernmental Panel on Climate Change (IPCC)

How Do Carbon Storage Techniques Stack Up?

To meet the goals of the Paris climate agreement and keep global warming under 1.5 degrees Celsius, the world will have to increase the amount of carbon dioxide pulled from the atmosphere, the IPCC reports. It compared the costs and storage potential of six key methods of carbon dioxide removal. Soil carbon sequestration is one of the cheapest with the most potential.

80 calibrated solutions to reverse global warming

Regenerative Agriculture
could result in *reduction of
23.2 gigatons of carbon
dioxide, from both
sequestration and reduced
emissions.*

NEW YORK TIMES BESTSELLER

REVERSE GLOBAL WARMING
EDITED BY PAUL HAWKEN

Best Agriculture practices to Reverse Global Warming

In international classification, Z.B.N.F comes under climate change resilient, **Agroecology**, more specifically under “Regenerative agriculture”.

Regenerative Agriculture is a holistic land management practice that leverages the power of photosynthesis in plants to close the carbon cycle, and build soil health, crop resilience and nutrient density.

sequestration

Z.B.N.F core principles

Beejamrutham

Microbial seed coating

- cow urine, cow dung, and lime – fermented

Jeevamrutham

Enhance soil

microbiome through bio stimulant - cow dung, cow urine, soil, jaggery, pulses flour – mixed and fermented

Waaphasa

Fast buildup of soil humus through ZBNF leading to **soil aeration** and **water vapor harnessing**

Achhadana

Ground to be kept **covered with diverse crops** and crop residues as **mulch**

Soil Food Web

ZBNF –farming in harmony with nature – to create soil carbon sponge

All Elements of Agroecology

ZBNF has a critical role in creating soil carbon sponge

Botanical extracts for Pest management

How do various principles of Z.B.N.F operate

1. Applying traditional inoculants as seed coating to stimulate profuse microbial growth.

Bio stimulants are stimulating natural beneficial microbes around the root zone to aid its growth.

Protecting the soil surface with mulch prevents evaporation losses.

Growing diverse crops is the key – root exudates from diverse crops enhance soil microbial diversity and lead to overall healthy crop growth and protection during dry spells or floods

Healthy Soil microbiome leads to soil structure and aeration – which fosters deep root growth, water holding, and access to water at greater depths

Other Principles and Practices in ZBNF

**Botanical extracts –
for pest management**

Minimal tillage

**All inputs to be made
within the village**

ZBNF is farming in harmony with nature – it is a transformational technology

Farmers' welfare

- Reduced costs and risks, increased yields, regular income, climate change resilience

Freedom from hunger

- More food, safe food and nutritious food

Youth welfare

- Reverse migration to villages

Environment

- Enhanced soil health, water conservation, regenerated coastal ecosystem, biodiversity.

Safeguarding our collective *future*

Maize	Irrigated	5204	3987	31%
Cotton	Irrigated	2183	1652	32%
Bengalgram	Rainfed	1769	1720	3%

Best Cases in 2019

Crop	ZBNF Yield (Kgs/acre)	Non-ZBNF Yield (Kgs/acre)	Percentage Change	Notes
SRI Samalu	525	320	61	Kilo Narsinga Rao, Killaguda , Sagar, Visakhapatnam
SRI Udalalu	1200	200	500	D Kondamma, D Chintalaveedi, Kuntarla cluster, Visakhapatnam
SRI Ragi	1820	300	507	P Govindu, Vanugupittu, Visakhapatnam
Cotton (irrigated)	750	450	66	K Bodinaidu, Mirthivalasa, Vizianagaram
Cotton (rainfed)	715	400	79	Mamidi Neelamma, Beemanandaravalasa, Vizianagaram

Single woman farmer

2 acres of land

ZBNF since 3 years

Converted 25 farmers

Name: J Malleswari

Village Name: Pedda mallapuram

Cluster Name: Shankavaram

District Name: East Godavari

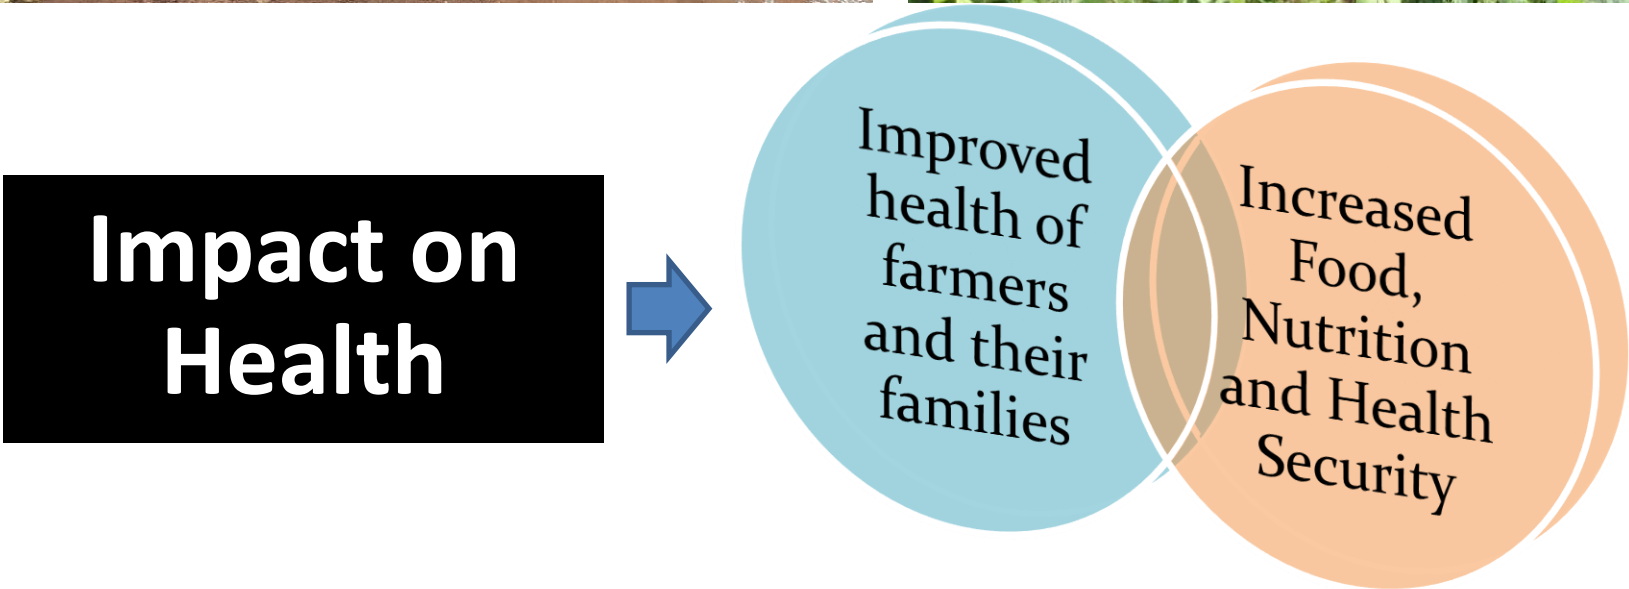

- Sole earning member for family
- Local CRP encouraged towards ZBNF
- Naturally grows rice; good in quality and taste well
- Voluntarily prepared ZBNF inputs to SHG women

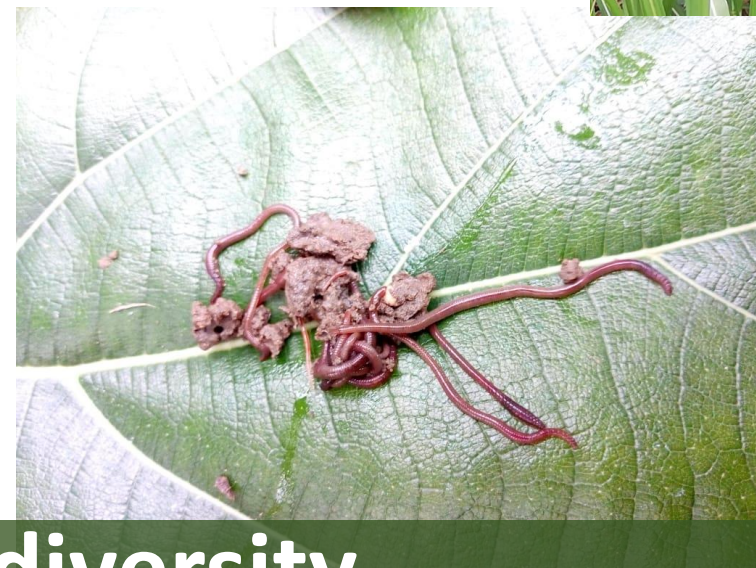

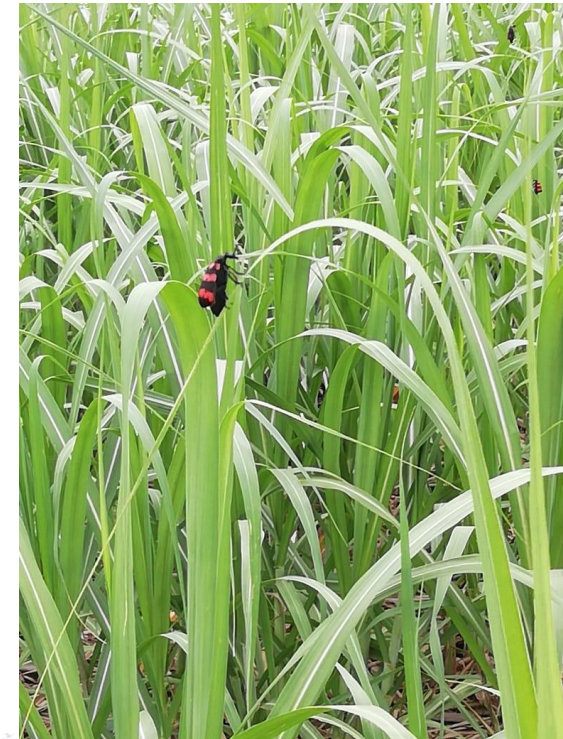

ZBNF YIELD- PADDY + MULTI CROPS (2 acres)

Crop	Yield	Income
Paddy	14 bags	Rs. 21,000
Groundnut, Finger millet, Black gram, Cowpea and Red gram	10 bags	Rs. 23,000
	<i>Cost of cultivation: Rs.16,700</i>	
	<i>Net income: Rs. 27,300</i>	

- Doesn't depend on external inputs for Cultivation of crops
- Started NPM shop
- Followed multi-cropping pattern
- High demand for produce at local market
- Encouraged by this and started ZBNF in leased land also
- Shared knowledge with SHG women

CEEW, CSTEP

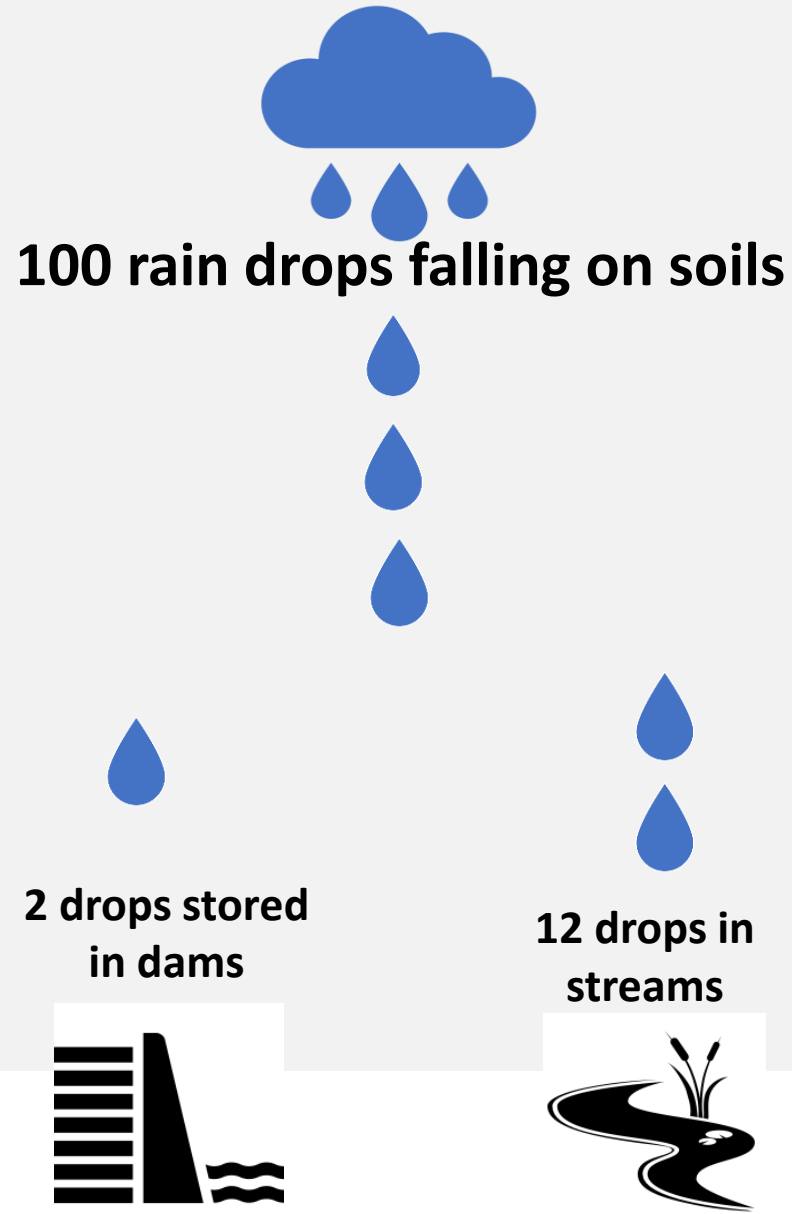

ZBNF enables drought proofing by better water infiltration and harnessing the rivers of water in the air

**there are Rivers in the air – air contains 10 times
the water in the rivers – 50,000 ppm**

What happens to the raindrops falling on soils – Global averages

86 drops?

Back to atmosphere

36 drops
transpiration and green
growth

50 drops
run-off /
evaporation

The diagram shows a large black water drop with two curved arrows pointing upwards from its surface, representing evaporation or transpiration. Below the drop, an upward-pointing arrow connects it to the text '50 drops run-off / evaporation'.

How to minimize runoff and evaporation losses ? How to convert these into Green growth

Can we tap the moisture in the air for Green growth

Drought proofing through ZBNF

Pre-monsoon sowing

- Sowing before Monsoon
- April onwards
- Effectively utilize the moisture available in the atmosphere

Dry sowing

- Sowing during dry-periods – throughout the year
- Dry situations regardless of regular monsoon
- Helps to maintain year-round ground cover in all districts

Pre-monsoon Sowing

Kurnool District, 19 September 2019

Chittoor District, 28 August 2019

Farmers took up pre monsoon sowing between April to June. Dry sowing in the months of July, Aug, Sep.

Dry sowing in Rabi – so that we can establish a 365 days green cover – **3 crops, even in dry lands of the state**

About half of the farmers experimenting Pre-monsoon sowing in AP are from four drought prone districts.

Large scale successful implementation by Farmers, Champion Farmers (CRPs) and Natural Farming Fellows (NFFs)

1800+

villages

4,307

acres

All 13

districts

12,549 Farmers took up PMDS

One of its kind initiative, in the world

Pre-Monsoon Dry Sowing

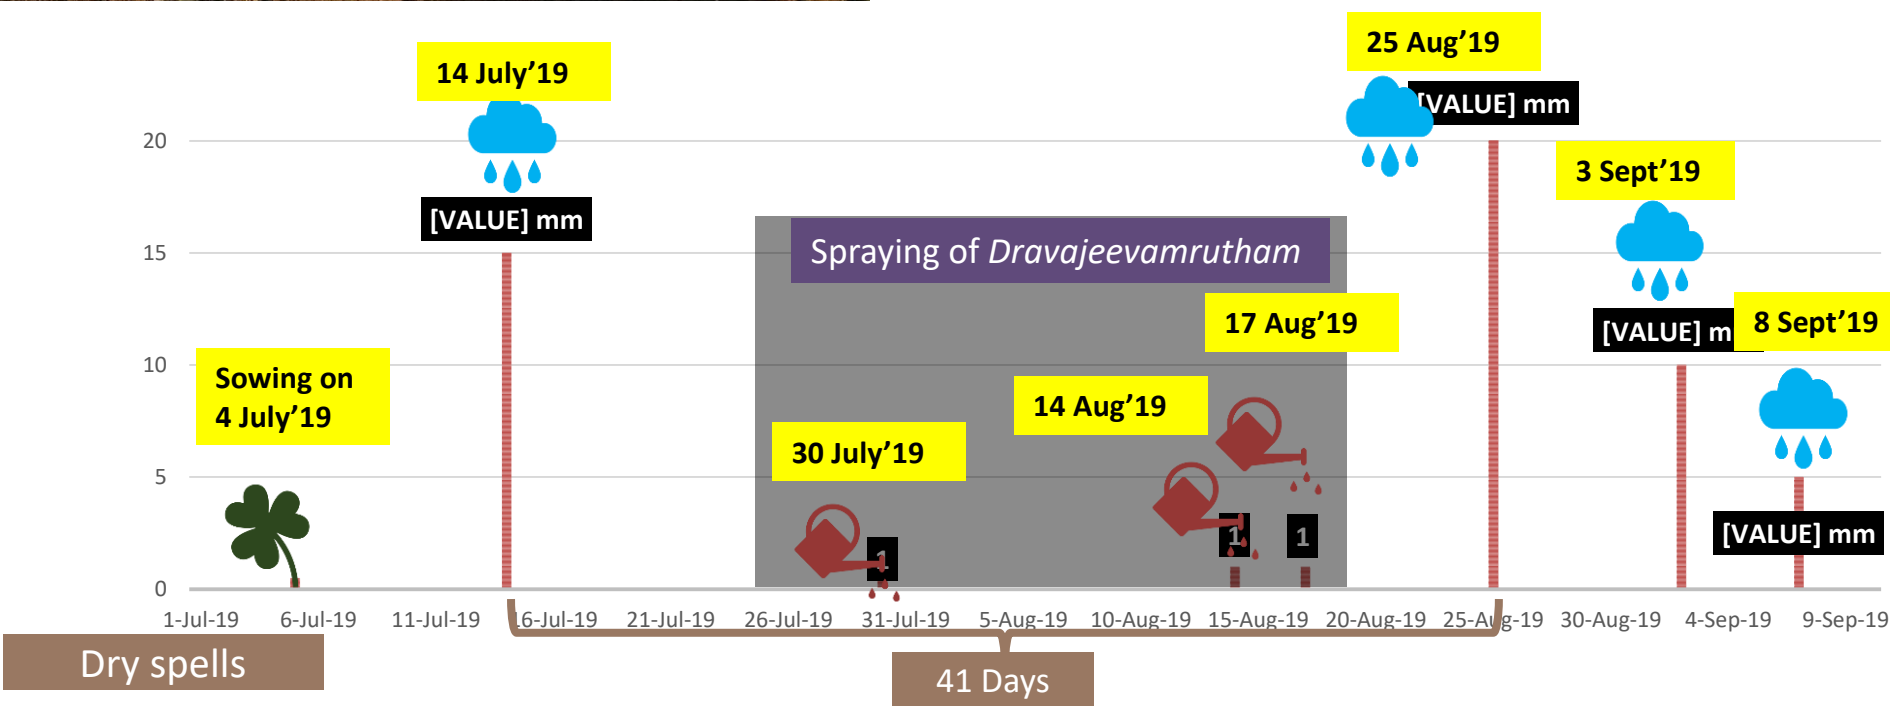

Date of sowing: 4 July 2019

15 November'19

95 Days post germination
harvested Foxtail millet

30 November'19

Harvested Castor

Harvested Gingelly

16th Nov - Mr. Walter Jehne, Soil- Microbiologist, Australia, visiting the PMDS field

PMDS is a global breakthrough

Analysis by Walter Jehne, a climate scientist from Australia :

PMDS crop – estimated to be 12 – 15 tons/hectare – this crop has consumed 15,000 tons of water
But, total water received through rainfall accounts for only 4000 tons of water.

Walter Jehne in his lecture in NITI Aayog on 25th Nov, 2019

‘ PMDS through ZBNF in A.P is a Global breakthrough. It is India’s unique contribution to the world’

Possible sources of water listed by Walter :

Bio stimulants used in ZBNF can lead to germination of plants without much water

Mycorrhizal fungi stimulated by biostimulants gets water to the roots from the soil film (beyond wilting point)

Increased Soil porosity enables roots to go deeper, better infiltration of rain water, and better water holding

Water vapour harvesting – major source of water after shoot develops

Types of water

Atmospheric water vapour
– 50,000 ppm

Dew, Haze after shoot emergence
– harvesting water vapour

Fungal hyphae – can
extend upto 25000 km
per cubic meter of
biologically healthy
soil

For germination
- Biological water
from Bio
stimulant and
mulch

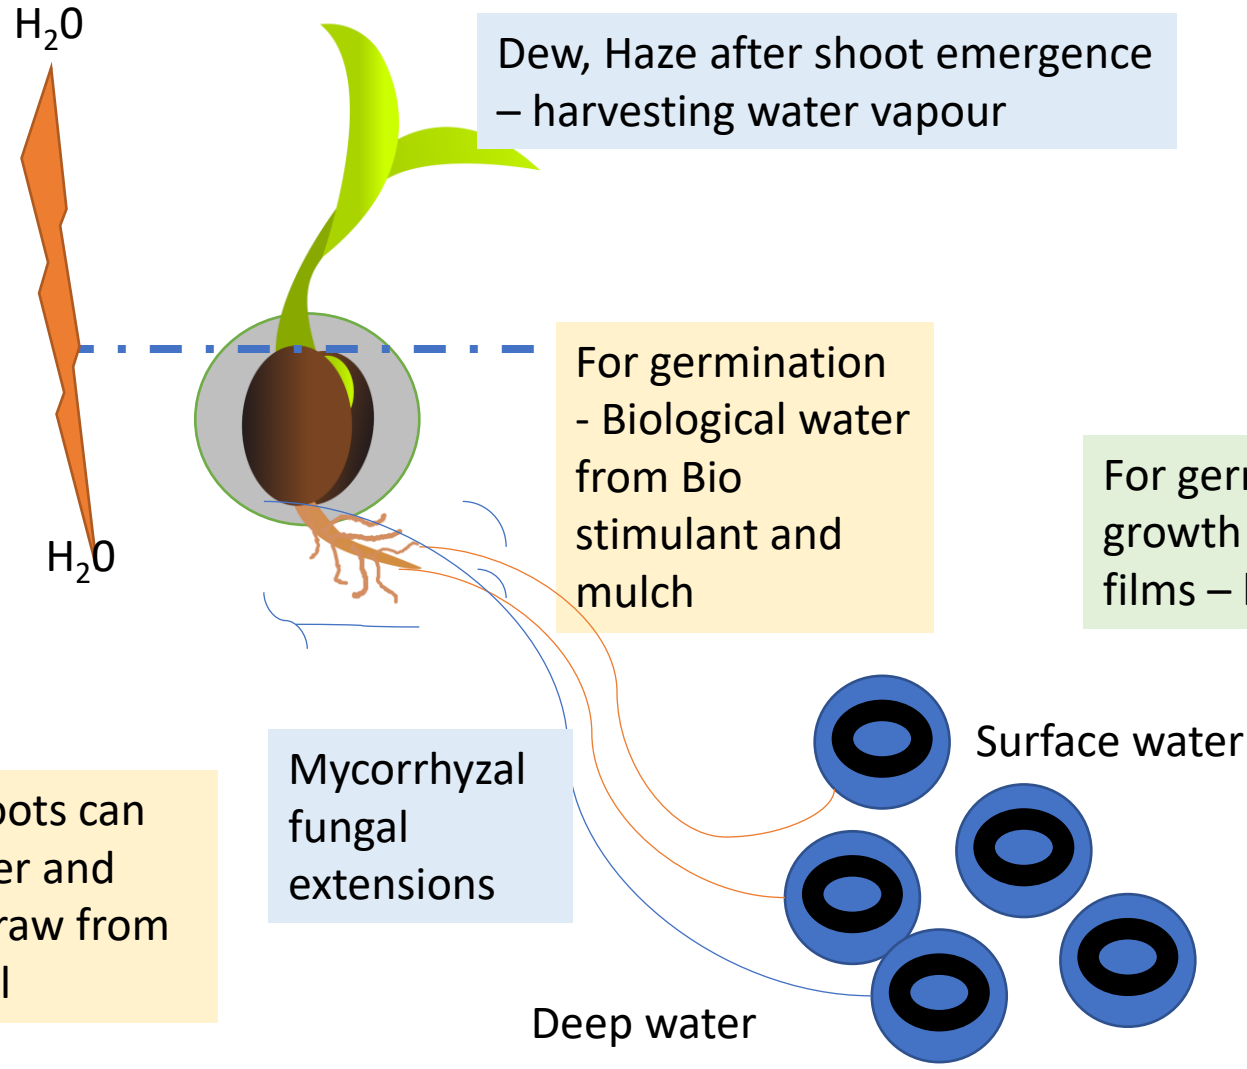

For germination and plant
growth -Uptake from soil
films – below wilting point

Greater porosity – roots can
explore deeper water and
fungal hyphae can draw from
soil film – in dry spell

Mycorrhizal
fungal
extensions

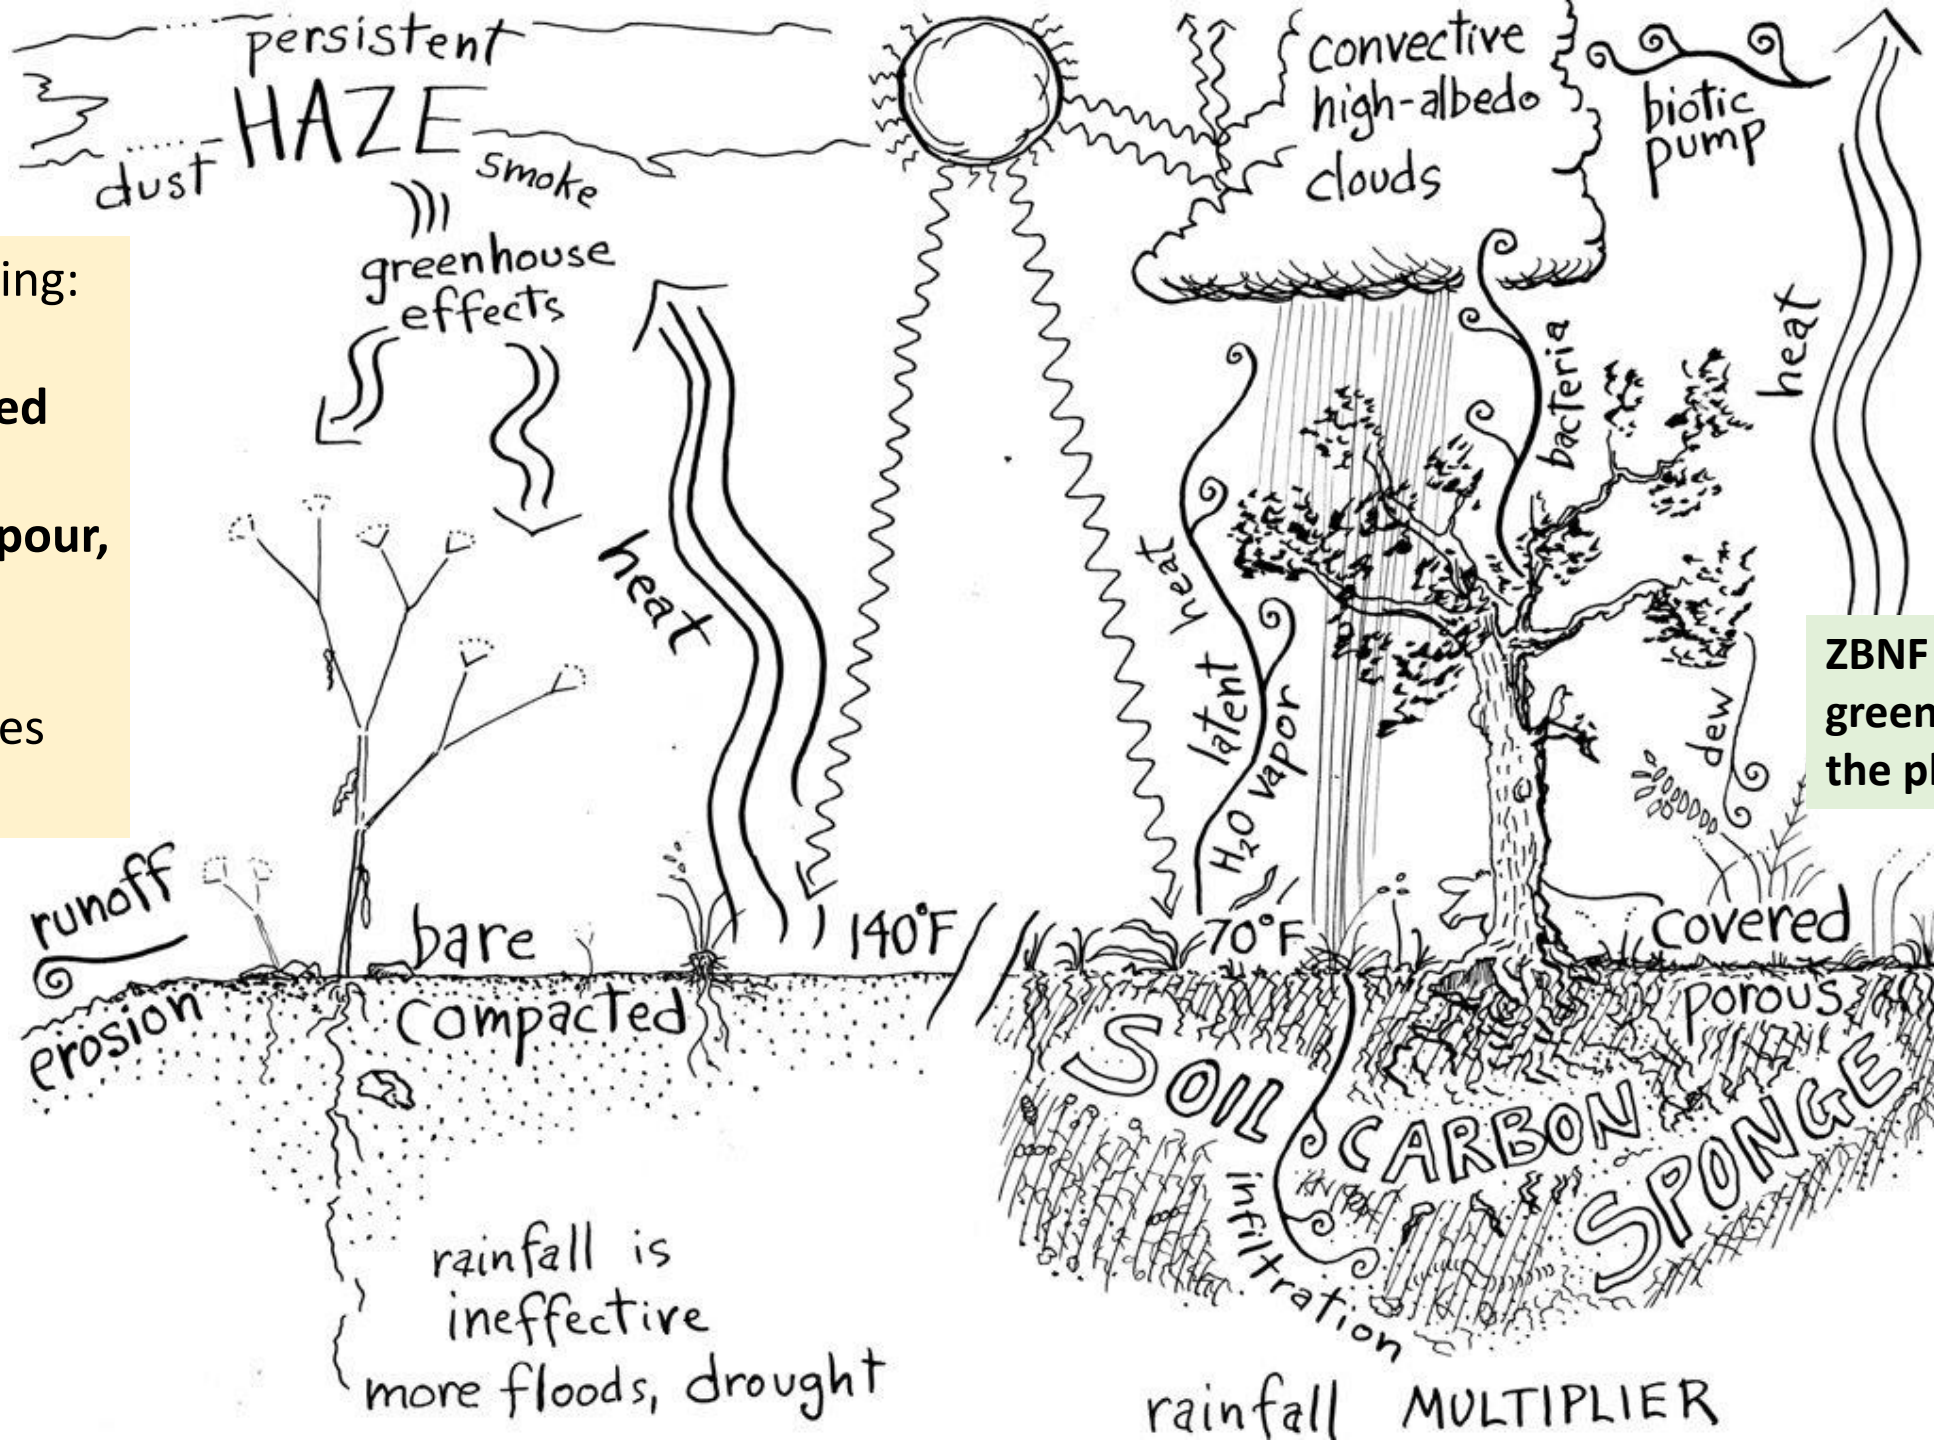

Surface water

Deep water

Global warming:

- 1. Re radiated heat
- 2. Water vapour, 80%
- 3. CO2 and other gases

ZBNF and 365 days green cover can cool the planet

The Vision - Farmers Outreach and Transformation

2019

- 50% GPs entered

2020

- All GPs entered

2021

- 350 Bio villages emerge

2022

- *Enrolling all farmers in the state*
- 1,000 Bio villages emerge

2024

- 3,000 bio villages emerge

2027

- All bio villages
- *Transforming all 60 lakh farmers to ZBNF*

All Villages

All Farmers

All Farms

All Practices

"..We do not inherit the earth from our ancestors, we borrow it from our children.."
